

TEKA

Whitepaper — Technology Ecosystem & Utility Token

Version 1.0 • August 2026

TEKA is an early-stage technology ecosystem focused on virtual digital products, tools, interactive experiences, and subscription-based services.

Disclaimer

This document describes the current development direction of TEKA and its intended utility model. It is not financial advice, an offer to sell securities, or a guarantee of future value, returns, exchange listings, or adoption. Product, tokenomics, deployment, and launch details may change as development progresses.

1. Project Overview

TEKA is a technology-focused digital ecosystem designed to develop virtual products, digital tools, interactive experiences, and subscription-based services. The TEKA token is intended to provide utility within selected parts of the ecosystem. The project is designed around practical digital use rather than positioning the token primarily as a speculative financial instrument.

2. Vision

The vision of TEKA is to create a recognizable technology ecosystem where virtual products and digital services can be accessed through a unified platform. The long-term direction includes reusable digital products, subscription features, community participation, and additional ecosystem services.

3. Problem & Approach

Digital products and virtual services are often distributed across disconnected platforms, accounts, and payment systems. TEKA aims to provide a unified technology ecosystem where selected virtual products and services can share a common access and utility layer. The project is being developed incrementally, beginning with its website and infrastructure and expanding toward practical digital products.

4. TEKA Token Utility

TEKA is intended as a utility token for selected ecosystem functions. Planned use cases include access to virtual gadgets, digital products, subscription-based services, and other ecosystem features where token-based access is appropriate. Additional utility may be introduced as products are developed. Utility is subject to product availability, technical implementation, and applicable legal requirements.

5. Token Information

Token name: TEKA

Symbol: TEKA

Total supply: 100,000,000 TEKA

Decimals: 18

Initial development network: Ethereum Sepolia Testnet

Current testnet contract: 0xf4B93222d36303A7eb30218a350cc0cA094D53DB

6. Supply & Distribution Direction

The current project plan considers an initial allocation of up to 45,000,000 TEKA for future circulation or distribution, while the remaining supply may be reserved for ecosystem development, liquidity, partnerships, treasury functions, and other clearly disclosed purposes. Final allocations, vesting schedules, and circulating supply will be published before any production launch.

7. Technology

The TEKA web ecosystem uses a modern frontend architecture with reusable components and a backend layer intended to support APIs, market data, authentication, and future blockchain-related services. The token implementation follows the ERC-20 model on Ethereum-compatible infrastructure. The current Sepolia deployment is used for development and testing.

8. Development Status

TEKA is currently an early-stage project. The public website, token contract, market-data functionality, SEO infrastructure, and project communication channels are being developed. The Sepolia token deployment should be considered a testnet implementation and not a production-market deployment.

9. Roadmap

Phase 1 — Foundation: website, branding, token contract, documentation, testnet deployment.

Phase 2 — Product: virtual digital products, subscription architecture, ecosystem services, backend expansion.

Phase 3 — Community: public documentation, community growth, partnerships, product feedback.

Phase 4 — Production: security review, final tokenomics, production blockchain deployment, liquidity strategy, and TGE planning.

Phase 5 — Ecosystem: additional products, integrations, subscriptions, and broader utility.

10. Community & Official Channels

Official X: @TEKAweb3

Website: <https://teka-web-beta.vercel.app/>

Telegram: <https://t.co/0dSEyfb6XL>

11. Security & Transparency

The project intends to publish relevant contract addresses, token supply information, launch details, and material ecosystem updates through official channels. Production deployment should be preceded by appropriate testing and, where feasible, independent security review. Testnet and production addresses will be clearly distinguished.

12. Risks

TEKA is an early-stage technology project and may face technical, market, adoption, regulatory, liquidity, security, and execution risks. The availability or success of future products is not guaranteed. Testnet tokens have no implied market value. Users should independently evaluate the project and its risks before interacting with any production deployment.

13. Conclusion

TEKA aims to develop a technology ecosystem centered on virtual digital products and practical digital services, with the TEKA token serving as a utility layer for selected ecosystem functions. The project is being developed incrementally, with transparency around its current testnet status and with

production launch details to be finalized as the technology and ecosystem mature.
